

Sulphur 95

Micronised sulphur for pH reduction

Vitax SulpHur 95 is a micronised elemental sulphur granule for the correction of sulphur deficiency, increase in soil micronutrient availability and pH reduction in fine sports and amenity turf.

Sulphur deficiency reduces the plant's ability to utilise applied nitrogen and may also reduce winter hardiness. Reducing soil pH can discourage worm-casting, encourage acid tolerant fescues and bents at the expense of *Poa Annua* and improve the availability of micronutrients such as copper, manganese and zinc.

Sulphur is converted to sulphuric acid by soil microbial activity. Vitax SulpHur 95 breaks down rapidly in moist soil conditions to a fine powder for a more rapid action.

DIRECTIONS FOR USE

Vitax SulpHur 95 can be used where soil analysis indicates excessively alkaline conditions. For fine turf and golf greens general recommendations to reduce pH by half a point would be 100 to 150 kg/ha (10-15 g/m²) product applied in the autumn, followed if required, by a further application at 100 to 150 kg/ha (10-15 g/m²) in early spring. The degree of pH reduction will vary, depending on soil type, and the effect on soil pH should be evident within 2-3 months. Further

applications can be made the following season if soil analysis indicates a further drop in pH is required.

Applications to turf should be limited to a maximum of 150 kg/ha (15 g/m²) per application, in order to avoid altering the pH balance of the soil too rapidly.

Best results are achieved by incorporation into the playing surface.

VITAX SULPHUR 95 contains 90% w/w sulphur

- Irritating to eyes
- Keep out of reach of children
- Avoid contact with eyes

• In case of contact with eyes, rinse immediately with plenty of water and seek medical advice

• If swallowed seek medical advice immediately and show this container or label

IRRITANT

Store in a cool, well-ventilated place protected from direct sunlight and humidity.
