

PRESTIGE[®]

Super Turf Solutions

Prestige Super Hydrate

Prestige Super Hydrate is an economical treatment of dry patch, drought stress and water repellent soils for golf fairways and sport fields. It can be used in conjunction with irrigation practices to ensure water penetrates down through into the soil profile quickly.

It's unique formulation provides faster water penetration and water conservation benefits by enabling moisture deeper into the root zone. Once in the Prestige Super Hydrate will keep performing enabling any subsequent irrigation water to infiltrate quickly into the rootzone. This conserves water that is lost through surface evaporation while optimizing water performance from irrigation or rainfall. The product is ideal to be used on associated fairways and outfield areas which require high water input to sustain plant health.

Benefits

- 2 in 1 formulation - Combined wetting agent and water conservation agent.
- Increases uniform irrigation water distribution, ideal to reduce irrigation requirements.
- Ideal product for larger amenity areas
- Less moisture loss through evaporation.
- Creates firm dry upper playing surfaces while maintaining moisture within the rootzone.
- Evenly distributes moisture through the soil profile.
- Improve the performance and efficiency of fertilisers.
- Tank mix compatible with most turf products.

Application Guidelines

Prestige Super Hydrate is best applied at 30 day intervals in a managed application programme. Start the programme with the first application in early spring (mid-March) at the curative application rate (20lts per Ha). Repeat as necessary during spring to autumn period at the programmed use rate (10lts per Ha) at monthly intervals. For the best results irrigate after application or apply before rainfall.
